Location: Idaho Falls, ID

Date of Work: December, 2011

Project: B-2578 - Transformer from factory to nearest rail siding

This transformer moved from Mexico all the way up to Idaho Falls, ID. HLL was responsible for shipping this unit, by rail, to the rail siding nearest the final installation location. Once loaded at the factory in Mexico, the transformer began its journey all the way across the US on a trip that was over 2,000 rail miles. Once the rail car and transformer were spotted at the customer's preferred offload location, the securing was removed from the transformer and the impact recorders were checked for impacts. Once they were cleared for offload, HLL completed the project by megger tested this unit to make sure everything was functioning properly.
